The declarations of interest of all scientific experts active in EFSA's work are available at <https://open.efsa.europa.eu/experts>

## Abstract

This scientific report provides an update of the *Xylella* spp. host plant database, aiming to provide information and scientific support to risk assessors, risk managers and researchers dealing with *Xylella* spp. Upon a mandate of the European Commission, EFSA created and regularly updates a database of host plant species of *Xylella* spp. The current mandate covers the period 2021–2026. This report is related to the 11th version of the database published in Zenodo in the EFSA Knowledge Junction community, covering literature published from 1 January 2024 up to 30 June 2024, and recent Europhyt outbreak notifications. Informative data have been extracted from 27 selected publications. One new host plant (*Quercus orocantabrica*) was identified and added to the database. It was naturally infected by *X. fastidiosa* subsp. *fastidiosa* in Portugal. No additional data were retrieved for *X. taiwanensis*, and no additional multilocus sequence types (STs) were identified worldwide. New information on the tolerant/resistant response of plant species to *X. fastidiosa* infection were added to the database. The *Xylella* spp. host plant species were listed in different categories based on the number and type of detection methods applied for each finding. The overall number of *Xylella* spp. host plants determined with at least two different detection methods or positive with one method (between sequencing and pure culture isolation (category A), reaches now 452 plant species, 204 genera and 70 families. Such numbers rise to 713 plant species, 312 genera and 89 families if considered regardless of the detection methods applied (category E).

## KEY WORDS

data extraction, database, host plants, sequence types, subspecies, *Xylella fastidiosa*, *Xylella* spp.

## 1 | INTRODUCTION

### 1.1 | Background and Terms of Reference as provided by the requestor

In the context of Article 31 of Regulation (EC) No 178/2002, EFSA was asked by the European Commission DG SANTE to provide technical assistance in the field of plant health as regards the regulated harmful organism *Xylella fastidiosa*, as per letter to EFSA's Director dated 30 June 2016 (Reference ARES (2016) 3126989).

EFSA was requested to further specify and update the host plants database of *X. fastidiosa* available in 2016 (EFSA, 2016) taking into account the different *X. fastidiosa* subspecies and strains (with particular reference to the European isolates), with the inclusion of information on non-susceptible plants and varieties and negative results of diagnostic tests when available. EFSA was requested to maintain and update this database periodically and to make new releases available on the EFSA website, together with a Scientific Report. The database should focus on plants confirmed to be infected by at least two detection methods in field conditions or via vector transmission under experimental conditions. Such request was for the period 2016–2020.

This mandate was extended by the European Commission DG SANTE for the period 2021–2026, with the aim to continue the update of that database. EFSA is requested to deliver two updates per year of the database.

### 1.2 | Interpretation of the Terms of Reference

EFSA delivered in September 2018 a renovated database of host plants of *Xylella* spp., taking into account both species of the genus *Xylella* (*X. fastidiosa* and *X. taiwanensis*) (EFSA, 2018), which was last updated in July 2024 (EFSA, 2024). Raw data and interactive reports were published in Zenodo<sup>1</sup> in the EFSA Knowledge Junction community and in Microstrategy<sup>2</sup> platform, together with a Scientific Report.

As per terms of reference (ToR), EFSA was requested to maintain and update the *Xylella* spp. host plant database for the period 2021–2026, and to publish new releases online together with a report twice per year. This Scientific Report provides a new update on the database of host plants of *Xylella* spp. published in July 2024 (EFSA, 2024). An extensive literature search was conducted to retrieve recent publications on the topic and new informative data on host plant species of *Xylella* spp. were collected. Such report provides information on the literature review and a detailed view on the currently known host plants of *Xylella* spp.

## 2 | DATA AND METHODOLOGIES

The methodologies developed for the *Xylella* spp. host plant database published in 2018 (EFSA, 2018) were applied in this report.

The process was divided in the following steps:

- Extensive literature search to identify relevant references.
- Selection of studies based on title, abstract and full text.
- Data extraction of relevant information.
- Data analysis and reporting.

### 2.1 | Extensive literature search

The review question, 'Which plant species can host *Xylella*/*Xylella* associated disease?' was broken down into key stages using the P/O conceptual model described in the EFSA systematic review guidance (EFSA, 2010):

- Population of interest (P)

The population of interest is that of plant species, worldwide.

- Outcome (condition of interest) (O)

The outcome (condition of interest) is that of *Xylella* spp. infection.

Two main elements were considered for the extensive literature search: the sources of information (Table 1) to be consulted and the search strategy (Table 2).

<sup>1</sup><https://doi.org/10.5281/zenodo.1339343>.

<sup>2</sup><https://www.efsa.europa.eu/en/microstrategy/xylella>.

## 2.1.1 | Information sources

The search strategy was run in all databases listed in [Table 1](#) via the Web of Science (Clarivate Analytics) and Scopus platforms with no language or document type restriction.

## 2.1.2 | Search terms

The syntax of the search string, developed for the *Xylella* spp. host plants database published in 2018 ([EFSA, 2018](#)), was adapted and run into each platform databases listed in [Table 1](#) on 15 July and 19 November 2024. As the scope of the search was to retrieve references published after January 2024, the selected time span was from 1 January 2024 up to 30 June 2024. The search strings and the number of retrieved references are shown in [Table 2](#).

**TABLE 2** Search strings and results.

Platform	Query	Results
Scopus	(TITLE-ABS-KEY (xylella OR xyllela OR xylela OR (pierce* W/2 disease) OR (((plum OR plums) AND "leaf scald*") OR ((phony W/2 (peach* OR disease*))) OR ((citrus AND variegat* AND chlorosis)) OR crespera OR "almond leaf scorch*" OR "bacterial leaf scorch*" OR "coffee leaf scorch*" OR "mulberry leaf scorch*" OR "oleander leaf scorch*" OR "sycamore leaf scorch*" OR "Periwinkle wilt" OR "Ragweed stunt" OR ((olive W/50 "quick decline syndrome")) OR "Xylem inhabiting bacteri*" OR "Xylem limited bacteri*" OR fxib OR fxjb OR "rickettsialike bacteri*" OR "rickettsia like bacteri*") AND (ORIG-LOAD-DATE >20230701 AND ORIG-LOAD-DATE <20231231))	67
Web of Science	TS=(xylella OR xyllela OR xylela OR (pierce* NEAR/2 disease) OR (((Plum OR plums) AND "leaf scald*") OR ((Phony NEAR/2 (peach* OR disease*))) OR ((citrus AND variegat* AND chlorosis)) OR crespera OR "almond leaf scorch*" OR "bacterial leaf scorch*" OR "coffee leaf scorch*" OR "mulberry leaf scorch*" OR "oleander leaf scorch*" OR "sycamore leaf scorch*" OR "Periwinkle wilt" OR "Ragweed stunt" OR ((Olive NEAR "quick decline syndrome")) OR "Xylem inhabiting bacteri*" OR "Xylem limited bacteri*" OR FXIB OR FXJB OR "rickettsialike bacteri*" OR "rickettsia like bacteri*")	99

The collected references were downloaded and imported into an EndNote X9 library (Clarivate Analytics). Duplicates and references already included in the update published in July 2024 (EFSA, 2024) were removed using EndNote X9 and the remaining references were uploaded on DistillerSR online<sup>3</sup> together with the full texts in portable document format (pdf). Eight Europhyt outbreak notifications<sup>4</sup> (accessed on 16 September 2024) were also included.

## 2.2 | Study selection

The collected references were screened for relevance in two steps:

1. Title and abstract screening.
2. Full-text screening of the references that passed the first step.

Inclusion/exclusion criteria were applied in each step and two reviewers worked in parallel screening the references.

The first step required the reviewers to answer two questions, listed in Table 3, considering only title and abstract of the references. The aim of this step was to select only references presenting original research data on *Xylella* or *Xylella*-associated disease.

**TABLE 3** Inclusion/exclusion criteria for title and abstract screening.

Question text	Type of answer	Answer text	Exclusion criteria
Is <i>Xylella</i> /a <i>Xylella</i> associated disease/a <i>Xylella</i> synonym the topic of the study?	Only one of the possible alternative answers can be selected	Yes	Included
		No	Excluded
Is it a primary research study?	Only one of the possible alternative answers can be selected	Yes	Included
		No	Excluded

The references that passed the first step, were submitted to the full text screening. This second step required the reviewers to answer four questions (Table 4): three of them are descriptive (neutral) whereas the fourth has an inclusion/exclusion role.

**TABLE 4** Inclusion/exclusion criteria at full text screening.

Question text	Type of answer	Answer text	Exclusion criteria
Is an English abstract present?	Only one of the possible alternative answers can be selected	Yes	Neutral
		No	Neutral
Which is the type of the publication?	Only one of the possible alternative answers can be selected	Peer-reviewed article	Neutral
		Article	Neutral
		Book	Neutral
		Conference proceedings	Neutral
		Abstract	Neutral
		Technical publication/report	Neutral
		Other	Neutral
Is the <i>Xylella</i> host plant the main scope of the study?	Only one of the possible alternative answers can be selected	Yes	Neutral
		No	Neutral
Is <i>Xylella</i> /a <i>Xylella</i> -associated disease/a <i>Xylella</i> synonym studied in association with a host plant?	Only one of the possible alternative answers can be selected	Yes	Included
		No	Excluded

## 2.3 | Data extraction

Informative data listed in Table 5 were extracted from the selected references. For each reference, the first reviewer performed the data extraction whereas the second reviewer conducted the quality check of the extracted data. Data extraction from each reference can generate one or several records. A record is defined as a unique combination of data related to a detection event, and it corresponds to a single Excel row of the files published in Zenodo (see Section 2.4.1).

<sup>3</sup><https://www.evidencepartners.com/>.

<sup>4</sup>[https://food.ec.europa.eu/plants/plant-health-and-biosecurity/europhyt/network\\_en](https://food.ec.europa.eu/plants/plant-health-and-biosecurity/europhyt/network_en).

**TABLE 5** Data extraction structure.

Extracted data	Description
<b>General information</b>	<i>In this section, the general information about the study is reported</i>
RecordID	Unique number allocated to each row
RefID	Unique number allocated to each reference within the DistillerSR software
Reference	Full reference
Publication year	Year of the publication
Starting year	Starting year of the study, as reported in the publication
Ending year	Ending year of the study, as reported in the publication
<b>Botanical identification</b>	<i>The botanical identification of the plant, both as reported in the publication and according to the updated taxonomy of the EPPO Global Database,<sup>5</sup> is reported in this section</i>
Plant EPPO code	EPPO code of the plant species, from the EPPO global database. <sup>5</sup> For plant species not present in the EPPO global database, a new code was created in the EFSA catalogue
Plant family	Plant family, from the EPPO global database <sup>5</sup>
Plant genus	Plant genus, from the EPPO global database <sup>5</sup>
Plant species	Plant species, from the EPPO global database <sup>5</sup>
Reported plant species	Name of the plant species as reported in the publication
Common name	Common name of the plant species, as reported in the publication
Cultivar	Cultivar or plant variety, as reported in the publication
<b>Infection information</b>	<i>Detailed information about the infection and location of the plant is reported in this section</i>
Infection method (Level 1)	The infection of the plant can be natural, artificial or not specified
Infection method (Level 2)	Subcategories of natural infection: during survey activity, during research activity. 'Research activity' is used when plants are planted under natural inoculum pressure and infection development was monitored without interfering Subcategories of artificial infection: mechanical inoculation (detailed at level 3a), vector transmission (detailed at level 3b)
Mechanical inoculation (Level 3a)	Subcategories of mechanical inoculation: budding, grafting, needle, root uptake, stem absorption, syringe
Infection vector species (Level 3b)	Insect species used in artificial vector transmission
Location type	The place where the plant was placed: natural habitat, greenhouse, screenhouse, interception, not specified
<b>Geographic information</b>	<i>In this section, the geographical location of the plant is reported, as detailed as possible. In case of intercepted plants, the reported location is the geographical origin of the plant and not the country and location where it was intercepted</i>
Country code	From the EFSA catalogue, based on NUTS (Eurostat) and GAUL (FAO) territorial unit nomenclature
Country	From the EFSA catalogue, based on NUTS (Eurostat) and GAUL (FAO) territorial unit nomenclature
Location	Location description (state/region/province/municipality) from the EFSA catalogue, based on NUTS (Eurostat) and GAUL (FAO) territorial unit nomenclature
Additional Location	Additional information on the location, as reported in the publication
Coordinates precision	Coordinates as reported in the publication
Latitude	Latitude, as reported in the publication
Longitude	Longitude, as reported in the publication
<b>Pest description</b>	<i>Information about the pest is reported in this section, together with genetic data</i>
Pest EPPO code	EPPO code of the pest, from the EPPO global database <sup>5</sup>
Pest species	Name of <i>Xylella</i> spp., from the EPPO global database <sup>5</sup>
Pest subspecies	<i>Xylella fastidiosa</i> subspecies, from the EPPO global database <sup>5</sup> . If the subspecies is inferred from another publication, a note is added to comment on the genotyping
Reported pest	Name of <i>Xylella</i> spp. as reported in the publication. Names used before the genus <i>Xylella</i> was established (up to 1987): Alfalfa dwarf virus, <i>Morus</i> suffodiens virus, <i>Phony</i> peach bacterium, Pierce's disease bacterium, Pierce's disease virus, <i>Rickettsia</i> -like bacteria, rod-shaped bacteria, xylem-inhabiting bacteria. Names used from 1987 (when the genus <i>Xylella</i> was established): <i>Xylella fastidiosa</i> , <i>Xylella taiwanensis</i>
Disease	Name of the disease caused by <i>Xylella</i> spp., as reported in the publication: Alfalfa dwarf, Almond leaf scorch, Bacterial leaf scorch, Blueberry bacterial leaf scorch, Citrus variegated chlorosis, Coffee leaf scorch, Coffee stem atrophy, Crespera, Elm leaf scorch, Leaf scorch disease, Mulberry leaf scorch, Oleander leaf scorch, Olive quick decline syndrome, Pear leaf scorch, Pecan bacterial leaf scorch, Periwinkle wilt, Phony peach disease, Pierce's disease, Plum leaf scald, Potato purple top disease, Ragweed stunt, Sweetgum dieback, Sycamore leaf scorch

<sup>5</sup><https://gd.eppo.int/>.

**TABLE 5** (Continued)

Extracted data	Description
Strain	Name of the strain of <i>Xylella</i> spp., as reported in the publication
MLST (Multilocus sequence type)	Sequence type (ST) of <i>Xylella fastidiosa</i> , as reported in the publication. If the ST is inferred from another publication, a note is added in the genotyping comment
Genotyping comment	Comment or additional information regarding the pest
<b>Methods of identification</b>	<i>In this section, the identification methods applied to detect <i>Xylella</i> spp. infection are listed. Eight detection methods were considered and for each of them, the outcome of the analysis (positive or negative), together with the number of infected plants and the total number of analysed plants, were reported. Moreover, additional information could be added in the comment column beside each detection method</i>
Symptoms	Observation of symptoms in the plant, as reported in the publication
Symptoms expression in test plants	Observation of symptom development in test plants after an attempt to transmit the pathogen through vectors
Culture	Pure culture isolation (i.e. isolation of cultivable bacteria from tissue samples on solid culture media)
Microscopy	Observation of <i>Xylella</i> spp. bacteria through microscopic analysis techniques
ELISA	Enzyme-linked immunosorbent assay
Other immunological techniques	Immunological techniques other than ELISA
PCR-based methods	Polymerase chain reaction-based methods (PCR, nested PCR, qPCR, etc.)
Sequencing	Sequence analysis
<b>Host status</b>	<i>Information about the tolerance and resistance response of the plant</i>
Tolerance/resistance reported	Tolerant/resistant status of the plant, as reported in the publication
Tolerance/resistance category	Categories describing the response of the tolerant/resistant plant: lack of infection or negative reading, lack of systemic movement, lack or reduction of symptoms, lack or reduction of symptoms – lower bacterial population, lack or reduction of symptoms – lower bacterial population – lower disease incidence, lack or reduction of symptoms – lower disease incidence, lower bacterial population, lower bacterial population – lower disease incidence, lower disease incidence, infection not persistent, reported as tolerant/resistant (no details)
Tolerance/resistance comment	Comment on the tolerant/resistant response of the plant, as reported in the publication
<b>Additional information</b>	
Comment	Additional relevant information or comment on the study
Confirmed record	'Yes' for confirmed records, 'No' for unconfirmed/dubious records. Unconfirmed records were included in the data extraction but excluded from the data analysis

## 2.4 | Data warehouse

A harmonised data model has been established to collect data on *Xylella* spp. host plants. The aim was to establish a harmonised data flow for the collection and the collation of an extensive literature review generated data in the plant health domain. Data are stored in EFSA Scientific Data Warehouse (S-DWH), after that an ETL (Extract, Transform, Load) procedure is applied in order to harmonise and calculate the statistics.

### 2.4.1 | Data management

The collected data have been submitted to the EFSA Data Collection Framework (DCF). DCF is the upfront system in the EFSA pipeline of data collection tools and allows a first step of harmonisation against the EFSA controlled reference terminology (aka EFSA catalogues). Data have been then included in the S-DWH by means of a standardised extract transform load (ETL) procedure and they have been further analysed and managed to generate needed statistics.

Data are available as interactive reports on the Microstrategy platform at the following link: <https://www.efsa.europa.eu/en/microstrategy/xylella>.

Raw data and related metadata are published in Zenodo in the EFSA Knowledge Junction community, this report refers to version 11 (<https://doi.org/10.5281/zenodo.1339343>).

### 2.4.2 | Data reporting

Data reporting was designed to distinguish the *Xylella* spp. host plant species, based on the number and type of detection methods applied for each finding. Different combinations of detection methods were considered:

**A.** Plant species positive with at least two detection methods (among: ELISA, other immunological techniques, PCR-based methods, symptoms observation on the test plant in experimental vector transmission) or positive with one method (between sequencing and pure culture isolation).

**B.** All plant species included in category A, plus plant species positive with at least two detection methods (including microscopy).

**C.** All plant species included in category B, plus plant species positive with at least one detection method (among: ELISA, other immunological techniques, PCR-based methods, symptoms observation on the test plant in experimental vector transmission).

**D.** All plant species included in category C, plus plant species positive with microscopy.

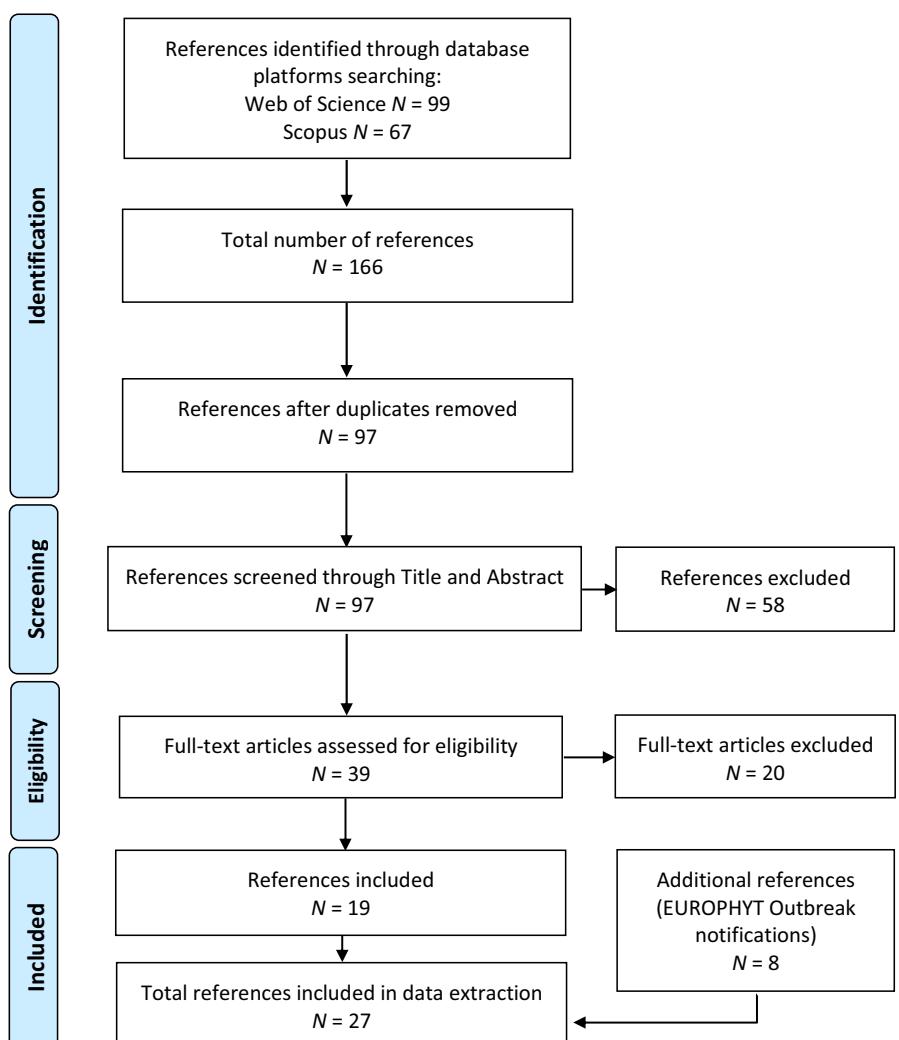

**E.** All positive plant species reported, regardless of the detection methods applied (including positive records but without the detection method specified, ELISA, microscopy, other immunological techniques, PCR-based methods, pure culture isolation, sequencing, symptom observations, symptoms observation on the test plant in experimental vector transmission).

## 3 | RESULTS

### 3.1 | Results of the literature review

The extensive literature search was conducted on 15 July and 19 November 2024 on Web of Science and Scopus platforms and 166 references were collected. Duplicates and references already included in EFSA (2024) were removed and 97 references were uploaded in DistillerSR and screened for relevance. Results of the screening process are shown in Figure 1.

In the first step, i.e. title and abstract screening, 58 references were excluded either because they do not focus on *Xylella* or *Xylella* associated diseases and/or they are not primary research studies. The selected 39 references were subjected to the second step of the screening process, i.e. the full-text screening. Nineteen references, in which *Xylella* spp. are studied in association with a host plant, were selected. Eight Europhyt outbreak notifications<sup>6</sup> containing informative data and two additional references were also included in the data extraction. Totally, 27 references (listed in Appendix E) were included in this update of the database and from which informative data listed in Table 5 were extracted.

**FIGURE 1** Flow diagram of the screening process.

<sup>6</sup>[https://food.ec.europa.eu/plants/plant-health-and-biosecurity/europhyt/network\\_en](https://food.ec.europa.eu/plants/plant-health-and-biosecurity/europhyt/network_en).

Two scientific papers (by Bruno, 2024 and by Pagano et al., 2024) were reviewed but then listed in the database as not confirmed, because the infection by *X. fastidiosa* was based on symptoms only without any diagnostic test confirming the infection. Nine records on mixed infection by different *X. fastidiosa* from Spain were also added to the not yet confirmed records, because of the pending results for ST types (EuropHyd notification n. 124 – Update 35). All records listed as not yet confirmed in the database are periodically reviewed in case new evidence arise.

### 3.2 | Update of records already included in the database

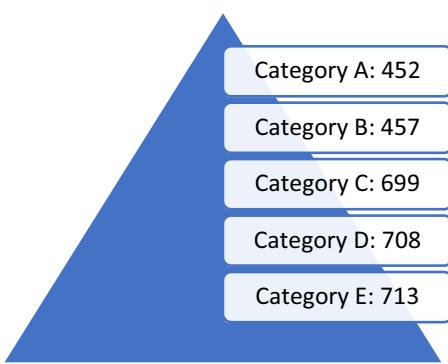

Scientific names of plant species, genera and families are reported, as far as possible, according to the taxonomy of the EPPO Global Database (EPPO, 2024) that is constantly being updated. Therefore, changes of scientific names of plant species, genera and families in the *Xylella* spp. host plant database are related to the update of the taxonomy in the EPPO Global Database.

Records referring to EuropHyd outbreak notifications, that may contain incomplete data, are updated whenever additional information (e.g. further identification of the plant species, *X. fastidiosa* subspecies, ST) become available.

Five records in the reference RefID 3995 (Velasco-Amo et al., 2022) already included in the previous versions of the database have been updated following a correction of the article RefID 4582 (Velasco-Amo et al., 2024). Information on ST and plant species reported in Table 1 of Velasco-Amo et al. (2024) was corrected as indicated in RefID 4582: *X. fastidiosa* subsp. *multiplex* strains RH1 (RecordID 12268) and LM10 (RecordID 12267) belong to ST7 instead of ST6; *X. fastidiosa* subsp. *multiplex* Fillmore (RecordID 12266) belongs to ST81 instead of ST6; regarding to *X. fastidiosa* subsp. *multiplex* ST6 IVIA6586-2 (RecordID 12291), this was isolated from *Helicrysum italicum*, and IVIA6629 (RecordID 12292) was isolated from *Rhamnus alaternus* instead than from *Prunus dulcis*.

### 3.3 | Host plant species of *Xylella* spp.

The updated numbers of host plant species, genera and families (according to the different categories reported in Section 2.4.2) are reported in Figure 2 and Table 6. The number of plant species raised to 452 according to category A [i.e. plant species positive with at least two detection methods (among: symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation) or positive with one method (between: sequencing, pure culture isolation)] to 713 plant species of category E (i.e. all positives plant species reported, regardless of the detection methods).

**FIGURE 2** Number of host plant species according to the different categories (as described in Section 2.4.2). Plant species in category A are included in category B; plant species in category B are included in category C; plant species in category C are included in category D; plant species in category D are included in category E.

**TABLE 6** Number of host plant species, genera and families of *Xylella* spp. according to categories A, B, C, D, E (based on the detection methods applied – see Section 2.4.2).

	A	B	C	D	E
<b>Number of host plant species</b>	452	457	699	708	713
<b>Number of host plant genera</b>	204	205	311	311	312
<b>Number of host plant families</b>	70	70	89	89	89

Compared to the previous update of the database published in July 2024 (EFSA, 2024), one taxa was added to the database (Table 7). The plant species was identified as infected by *X. fastidiosa* subsp. *fastidiosa* in natural conditions in the EU (Portugal). Neither new plant genera nor plant family were inserted in the database.

**TABLE 7** New host plants of *X. fastidiosa*. For each host plant, the infection method, the country, the *X. fastidiosa* subspecies and the category (see Section 2.4.2) are reported. The new family, new genera and new plant species are highlighted in bold.

Plant EPPO code	Plant family	Plant genus	Plant species	Infection method	Country	Xf subspecies	STs	Category
QUEOR	Fagaceae	Quercus	<b>Quercus orocantabrica</b>	Natural	Portugal	<i>fastidiosa</i>	Unknown	A

The overall number of host plant species infected naturally, artificially and in unspecified conditions by the different *X. fastidiosa* subspecies and according to the different categories are reported in Tables 8–10. The plant species behind the numbers shown in those tables are listed in Appendices A–C. In those appendices, the full lists of plant species infected by the different *X. fastidiosa* subspecies naturally, artificially and in not specified conditions according to the five categories are shown.

The highest number of plant species naturally infected is still recorded for *X. fastidiosa* subsp. *multiplex* (230 according to category A, up to 237 for category E), followed by subsp. *fastidiosa* and subsp. *pauca*. In artificial infection, 43 plant species (category A and 85 for category E) were successfully infected by *X. fastidiosa* subsp. *fastidiosa*. Twenty plant species were artificially infected by subsp. *pauca* and 21 by subsp. *multiplex* (category A), up to 36 and 39 for category E (for *pauca* and *multiplex*, respectively).

No new host plants were reported for the pathogen species *Xylella taiwanensis*, that so far was recorded only in *Pyrus pyrifolia* plants.

**TABLE 8** Number of host plant species, naturally infected, susceptible to the different *X. fastidiosa* subspecies according to categories A, B, C, D, E (as described in Section 2.4.2).

Category	<i>fastidiosa</i>	<i>fastidiosa_sandyi</i>	<i>morus</i>	<i>multiplex</i>	<i>pauca</i>	<i>sandyi</i>	<i>tashke</i>	Unknown
A	75	2	4	230	55	7	1	201

D	7	16	8	2	29
E	7	16	8	2	31

### 3.4 | *X. fastidiosa* sequence types and host plants association

The full list of plant species infected by the different *X. fastidiosa* sequence types (ST) under natural, artificial and unspecified conditions is reported in Appendix D. For each plant species, the number of records<sup>7</sup> reporting infection by a specific

<sup>7</sup>'Record' as defined in Section 2.3.

ST is counted. For natural infection, the country where the plant species have been identified is also reported, whereas for artificial and unspecified infection, only the total number of records is presented in the Appendix.

Forty-seven records reporting information of plant species infected by different STs were added to this update of the database, for a total number of 2857 records with information on 270 plant species and 89 different STs. No additional STs have been identified compared to the previous version of the database (EFSA, 2024). Most of the records (1988) refer to natural infections that were reported in North, Central and South America (United States of America, Mexico, Honduras, Costa Rica, Ecuador, Brazil and Argentina), Asia (Israel) and Europe (Portugal, Spain, France and Italy). ST53 (subsp. *pauca*) is still the most reported ST in natural infections (498 records), while ST1 (subsp. *fastidiosa*) remains the most used ST in artificial infections (315 records).

In particular, when looking at natural infections, in the new outbreak of *X. fastidiosa* subsp. *fastidiosa* ST1 in Apulia, which was reported for the first time in Italy (Europhyt notification n. 2529 – Update 2-5), *Vitis vinifera*, *Polygala myrtifolia*, *Prunus avium* and *Prunus dulcis* were reported to be naturally infected by ST1. Photos of Pierce's disease in *Vitis* in California (caused by *X. fastidiosa* subsp. *fastidiosa* ST1) are reported in Figure 3. In Portugal, *Genista tridentata* and *Cytisus* sp. were reported to be naturally infected by ST1 (respectively Europhyt notification n. 2099 – Update 1- and Europhyt notification n. 2139 – Update 3). *Vaccinium virgatum* was found naturally infected by *X. fastidiosa* subsp. *fastidiosa* ST1 in South Carolina (USA) (Cieniewicz et al., 2024).

For *X. fastidiosa* subsp. *multiplex* natural infections were reported: in Apulia (Italy) for *Prunus dulcis* naturally infected by ST26 (Europhyt notifications n. 2529 – Update 2-5 and n. 2549 – Update 00-01); in Portugal natural infections were reported by *X. fastidiosa* subsp. *multiplex* (ST type not determined) for *Cytisus* sp. (Europhyt notification n. 753 – Update 24) and for *Ulex micranthus* (Europhyt notification n. 753 – Update 24).

Other host plant species, recorded in literature by natural infection by *X. fastidiosa* (without indication of subspecies or ST type) or by artificial infection, were also added to the database.

**FIGURE 3** Photos of *Xylella* Pierce's disease in grapes provided by courtesy of Alexandra Kahn and Monica Donegan, University of California Berkeley: (A) leaf scorch on red grapes, (B) shrivelled berries, (C) matchstick petioles and drying leaves on white, (D) disease spreading from the left side of the plant.

### 3.5 | Tolerant and resistant responses of plant species

Information on tolerant and resistant response of plant species to *X. fastidiosa* infection have also been reported in the database. The list of plant genera and species for which tolerant and resistant responses have been identified is reported in Table 11. Different tolerant/resistant responses to *X. fastidiosa* infection have been grouped into 11 categories, as reported in Table 12. Those categories include the plant response/s for which the authors of the publication considered that plant as tolerant/resistant to *X. fastidiosa* infection.

Compared to the previous version of the database (EFSA, 2024), one record for *Prunus dulcis* reporting tolerance or resistance responses to *X. fastidiosa* was added to the database. The overall number of records of plant species with tolerance or resistance responses to *X. fastidiosa* is 781, and the most studied genera remains *Vitis*, *Citrus* and *Prunus* (Table 11). The new record added to the database was extracted from one recent publication, on natural infection (Table 12).

## 4 | CONCLUSIONS

Following a request from the European Commission, EFSA was asked to create, maintain and regularly update a database of host plant species of *Xylella* spp. This scientific report summarises the most interesting information reported in the new version of the database (**version 11**).

An extensive literature search was performed including all scientific papers published up to 30 June 2024, as well as additional Europhyt outbreak notifications (last accessed on 16 September 2024).

By these searches, 27 publications were selected and informative data were extracted. One plant species was identified as a new host of *X. fastidiosa*. It has been found to be naturally infected by *X. fastidiosa* subsp. *fastidiosa* in Portugal. No new data was retrieved for *X. taiwanensis*.

Compared to the previous version of the database (EFSA, 2024), no additional STs have been identified worldwide. Information on tolerant/resistant status were reported for 73 plant species in 149 publications, with a total number of 781 records.

The overall number of *Xylella* spp. host plants reaches now 452 plant species, 204 genera and 70 families for category A [i.e. plant species positive with at least two detection methods (among: symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation) or positive with one method (between: sequencing, pure culture isolation)], till 713 plant species, 312 genera and 89 families for category E (i.e. all positives plant species reported, regardless of the detection methods).

A further update of the EFSA database on *Xylella* spp. host plants is planned for June 2025 with the aim to provide useful information and scientific support to risk assessors, risk managers and researchers dealing with *Xylella* spp.

Data are available as interactive reports on the Microstrategy platform at the following link: <https://www.efsa.europa.eu/en/microstrategy/xylella>.

Raw data and related metadata are published in Zenodo in the EFSA Knowledge Junction community, this report refers to **version 11** (<https://doi.org/10.5281/zenodo.1339343>).

## ACKNOWLEDGEMENTS

EFSA wishes to acknowledge:

- Alžběta Mikulová for the review of the data extraction performed by the Tasking grant, for the data extraction from Europhyt Outbreak notifications, and for drafting the EFSA scientific report under a contract number EOI/EFSA/2022/01 – CT PLANTS 2024 27.

- Vincenzo Cavalieri and Pierfederico La Notte of the National Research Council, Institute for Sustainable Plant Protection (CNR-IPSP), Bari, Italy, for the support provided to this scientific output in the context of grant Specific Agreement n. 04-2023 under Framework Partnership Agreement n. GP/EFSA/PLANTS/2022/02-02.
- Antonio Vicent Civera (Chair of EFSA Panel of Plant Health) for reviewing this Scientific Report.
- Alexandra Kahn and Monica Donegan from the University of California Berkeley for kindly providing the photos of Pierce's disease symptoms in grapes in California.

## APPENDIX A

### Host plant species naturally infected

List of host plant species, naturally infected, of *X. fastidiosa* subsp. unknown (i.e. not reported in the publication), subsp. *fastidiosa*, subsp. *fastidiosa/sandyi*, subsp. *morus*, subsp. *multiplex*, subsp. *pauca*, subsp. *sandyi*, subsp. *tashke* and *X. taiwanensis* according to categories A, B, C, D, E (as reported in Section 2.4.2):

**A.** Plant species positive with at least two detection methods (among: symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation) or positive with one method (between: sequencing, pure culture isolation).

**B.** The same as point A, but also including microscopy: plant species positive with at least two detection methods (among: microscopy, symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation) or positive with one method (between: sequencing, pure culture isolation).

**C.** Plant species positive with at least one detection method (among: symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation).

**D.** Plant species positive with at least one detection method including microscopy (microscopy, symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation).

**E.** All positives plant species reported, regardless of the detection methods (positive records but without the detection method specified, symptom observations, microscopy, symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing, pure culture isolation).

## APPENDIX B

### Host plant species artificially infected

List of host plant species, artificially infected, of *X. fastidiosa* subsp. unknown (i.e. not reported in the publication), subsp. *fastidiosa*, subsp. *morus*, subsp. *multiplex*, subsp. *pauca*, subsp. *sandyi* and subsp. *tashke* according to categories A, B, C, D, E (as reported in Section 2.4.2):

**A.** Plant species positive with at least two detection methods (among: symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation) or positive with one method (between: sequencing, pure culture isolation).

**B.** The same as point A, but also including microscopy: plant species positive with at least two detection methods (among: microscopy, symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation) or positive with one method (between: sequencing, pure culture isolation).

**C.** Plant species positive with at least one detection method (among: symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation).

**D.** Plant species positive with at least one detection method including microscopy (microscopy, symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation).

**E.** All positives plant species reported, regardless of the detection methods (positive records but without the detection method specified, symptom observations, microscopy, symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing, pure culture isolation).

## APPENDIX C

### Host plant species infected in unspecified conditions

List of host plant species, infected in conditions not specified (i.e. the kind of infection (natural or artificial) was not specified in the reference), of *X. fastidiosa* subsp. unknown (i.e. not reported in the publication), subsp. *fastidiosa*, subsp. *multiplex*, subsp. *pauca* and subsp. *sandyi* according to categories A, B, C, D, E (as reported in Section 2.4.2):

**A.** Plant species positive with at least two detection methods (among: symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation) or positive with one method (between: sequencing, pure culture isolation).

**B.** The same as point A, but also including microscopy: plant species positive with at least two detection methods (among: microscopy, symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation) or positive with one method (between: sequencing, pure culture isolation).

**C.** Plant species positive with at least one detection method (among: symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation).

**D.** Plant species positive with at least one detection method including microscopy (microscopy, symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing and pure culture isolation).

**E.** All positives plant species reported, regardless of the detection methods (positive records but without the detection method specified, symptom observations, microscopy, symptoms observation on the test plant in experimental vector transmission, ELISA, other immunological techniques, PCR-based methods, sequencing, pure culture isolation).

## APPENDIX D

### *Xylella fastidiosa* Multilocus sequence types

Number of records for each plant species natural, artificial and infected in not specified conditions by different multilocus sequence types (STs). The records for natural infection are divided per country. In general, the subspecies and the STs are reported as in the publication. If the subspecies and/or the STs are inferred from another publication or obtained from personal communication of the author of the publication, a note is added in the genotyping comment column of the excel file available in Zenodo in the EFSA Knowledge Junction community (<https://doi.org/10.5281/zenodo.1339343>). Abbreviations: AR (Argentina), BR (Brazil), CR (Costa Rica), EC (Ecuador), FR (France), HN (Honduras), IL (Israel), IT (Italy), MX (Mexico), PT (Portugal), ES (Spain), US (United States of America).
